

SMiDSY TSR-2 *Visual Turn Signal Reminder*

Unit Function

The SMiDSY TSR-2 *Visual Turn Signal Reminder* is mounted in the cockpit area of your bike and contains an amazingly bright green LED that is visible even in direct sunlight. In addition, the LED is modulated (a flicker effect) that you will notice even out of the corner of your eye. As light levels drop towards dusk, so does the output level of the LED. Once it is dark, the LED will continue to flash at a dim level, but without the modulation, so as not to be distracting when riding at night.

PACK CONTENTS: TSR-2 Unit, Cable Ties, Cable Tie Base, Heat Shrink Sleeves, Sticky Pads, Installation Instructions.

Installation

Mount the unit in the cockpit area with the LED in clear view. You can use the supplied sticky pads to mount to a flat surface, attach the supplied cable tie base to the unit, or any other method suitable for your bike. There are 3 wires exiting the unit, one is a pair, Black & Black/White, the other is a single Black wire. The pair of wires will go to either the left or right hand side turn signal and the single wire to the turn signal on the opposite side. Correctly identify the Ground & +12V wires leading to your turn signals using a test meter, and then splice the wires as shown below. Ensure your wiring is tidy and will not interfere with any moving parts of your bike. The unit is waterproof, but *never* direct a high pressure water jet at the device.
